

# 21st century changes in the Arctic sea ice cover

Constraining CMIP5 sea ice projections

**François Massonnet**

T. Fichefet, H. Goosse,  
C. Bitz, G. Philippon-Berthier,  
M. Holland, P. -Y. Barriat

Hamburg, MPI  
20 September 2012

*Mothers all want their sons  
to grow up to be president*

John F. Kennedy

*Mothers all want their sons  
to grow up to be president  
but they don't want them to  
become politicians in the process.*

John F. Kennedy

*CMIP5 contributors all want their model to grow up to be the best at projections but they don't want them to be evaluated in the process.*

A model user

# The spread in CMIP5 summer Arctic sea ice projections is still large

# The spread in CMIP5 summer Arctic sea ice projections is still large

Constraints and correlations

Yes, we can!

Effective model selection

# Constraints and correlations

Yes, we can!

Effective model selection

**A constrain is a set of rules  
that the model output must satisfy**

**Based on empirical relationships**  
between present-day and future properties

**If possible, with a physical basis**  
[Bitz, 2008; Boé et al., 2009; Holland et al., 2008]

**Arctic sea ice projections**  
thought to be « constrainable » [Collins et al., 2012]

Be careful when using correlations:  
know what you correlate

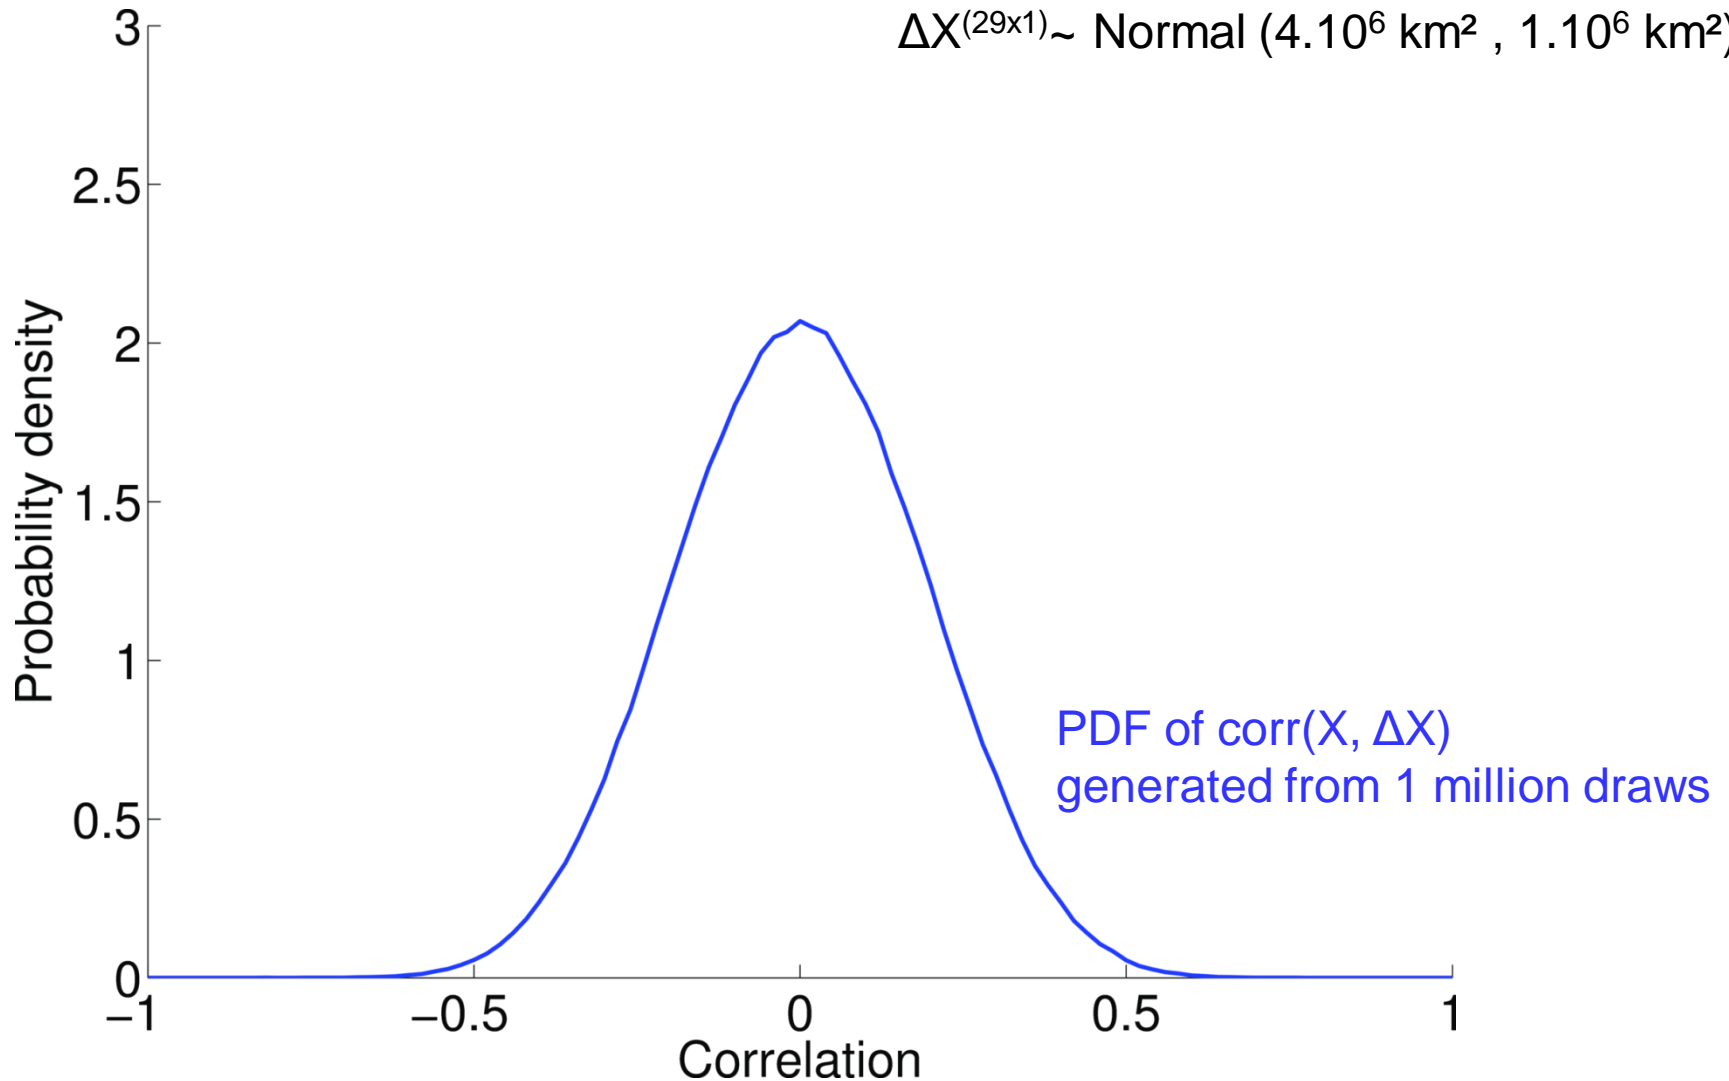

$X^{(29 \times 1)} \sim \text{Normal}(8 \cdot 10^6 \text{ km}^2, 1 \cdot 10^6 \text{ km}^2)$

$\Delta X^{(29 \times 1)} \sim \text{Normal}(4 \cdot 10^6 \text{ km}^2, 1 \cdot 10^6 \text{ km}^2)$

# Be careful when using correlations: know what you correlate

$X^{(29 \times 1)} \sim \text{Normal}(8 \cdot 10^6 \text{ km}^2, 1 \cdot 10^6 \text{ km}^2)$

$\Delta X^{(29 \times 1)} \sim \text{Normal}(4 \cdot 10^6 \text{ km}^2, 1 \cdot 10^6 \text{ km}^2)$

# Be careful when using correlations: know what you correlate

$X^{(29 \times 1)} \sim \text{Normal}(8.10^6 \text{ km}^2, 1.10^6 \text{ km}^2)$

$\Delta X^{(29 \times 1)} \sim \text{Normal}(4.10^6 \text{ km}^2, 1.10^6 \text{ km}^2)$

# Be careful when using correlations: compare apples with apples

September sea ice  
extent loss [ $10^6 \text{ km}^2$ ]  
w.r.t. 1979-2010 in  
**2030-2061**

# Be careful when using correlations: compare apples with apples

September sea ice  
extent loss [ $10^6 \text{ km}^2$ ]  
w.r.t. 1979-2010 in  
**2050-2081**

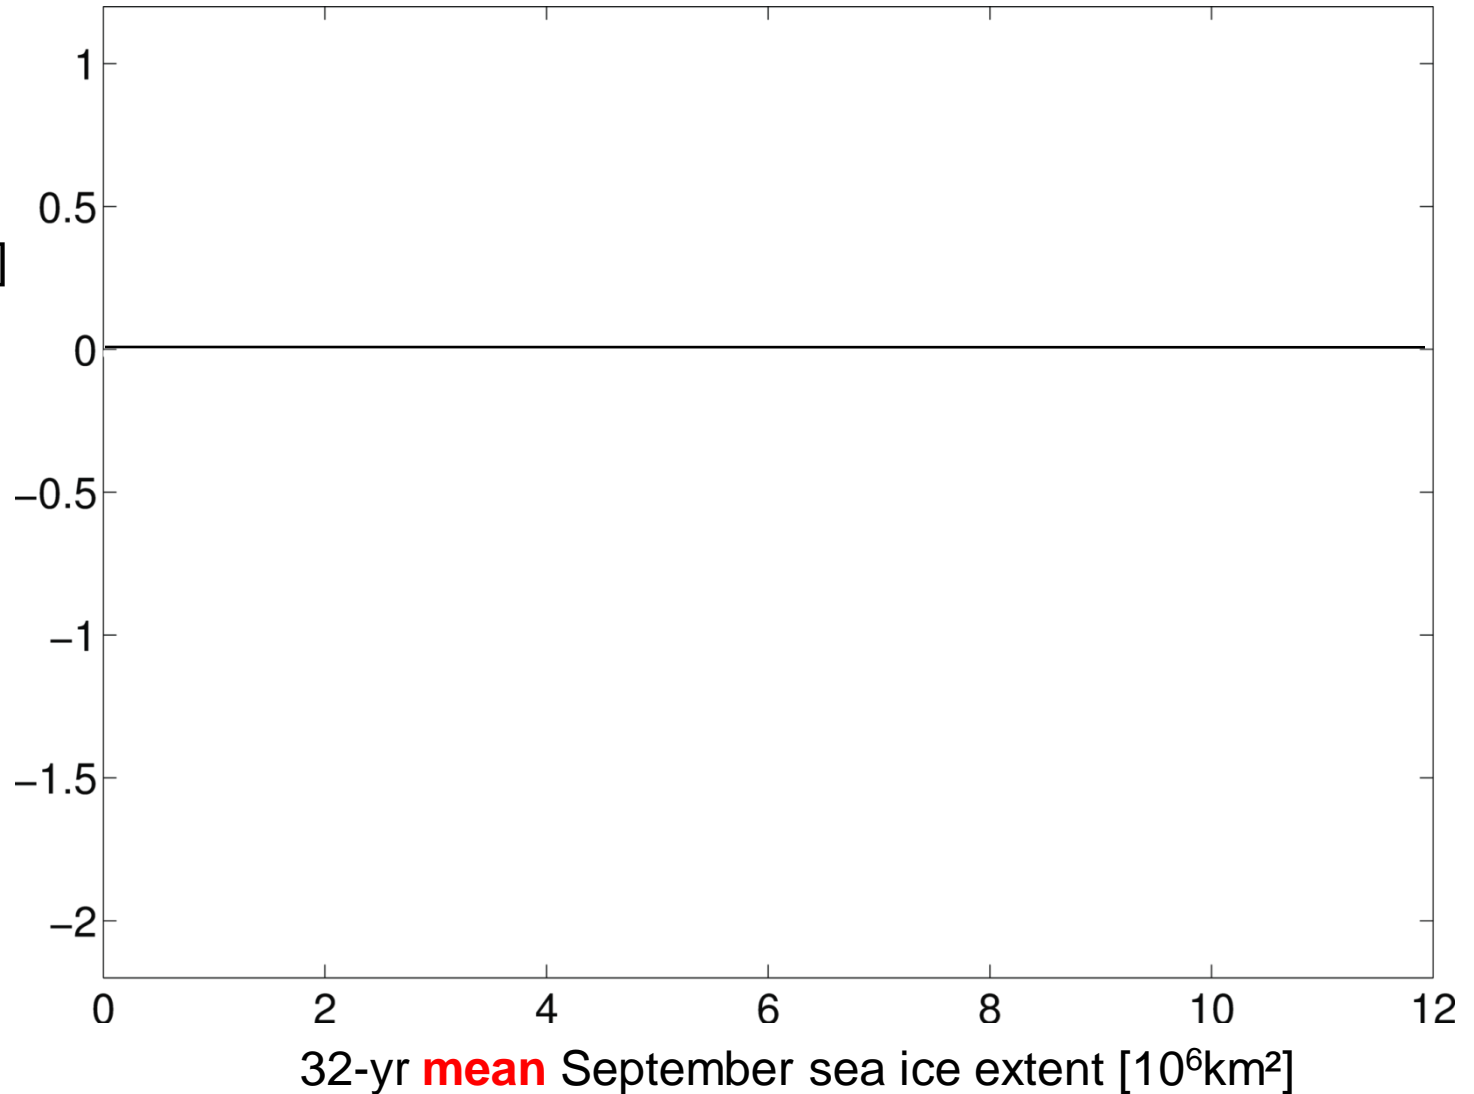

# Be careful when using correlations: compare apples with apples

September sea ice  
extent loss [ $10^6 \text{ km}^2$ ]  
w.r.t. 1979-2010 in  
**2060-2091**

# Mean sea ice conditions and variability are nonlinearly related to each other

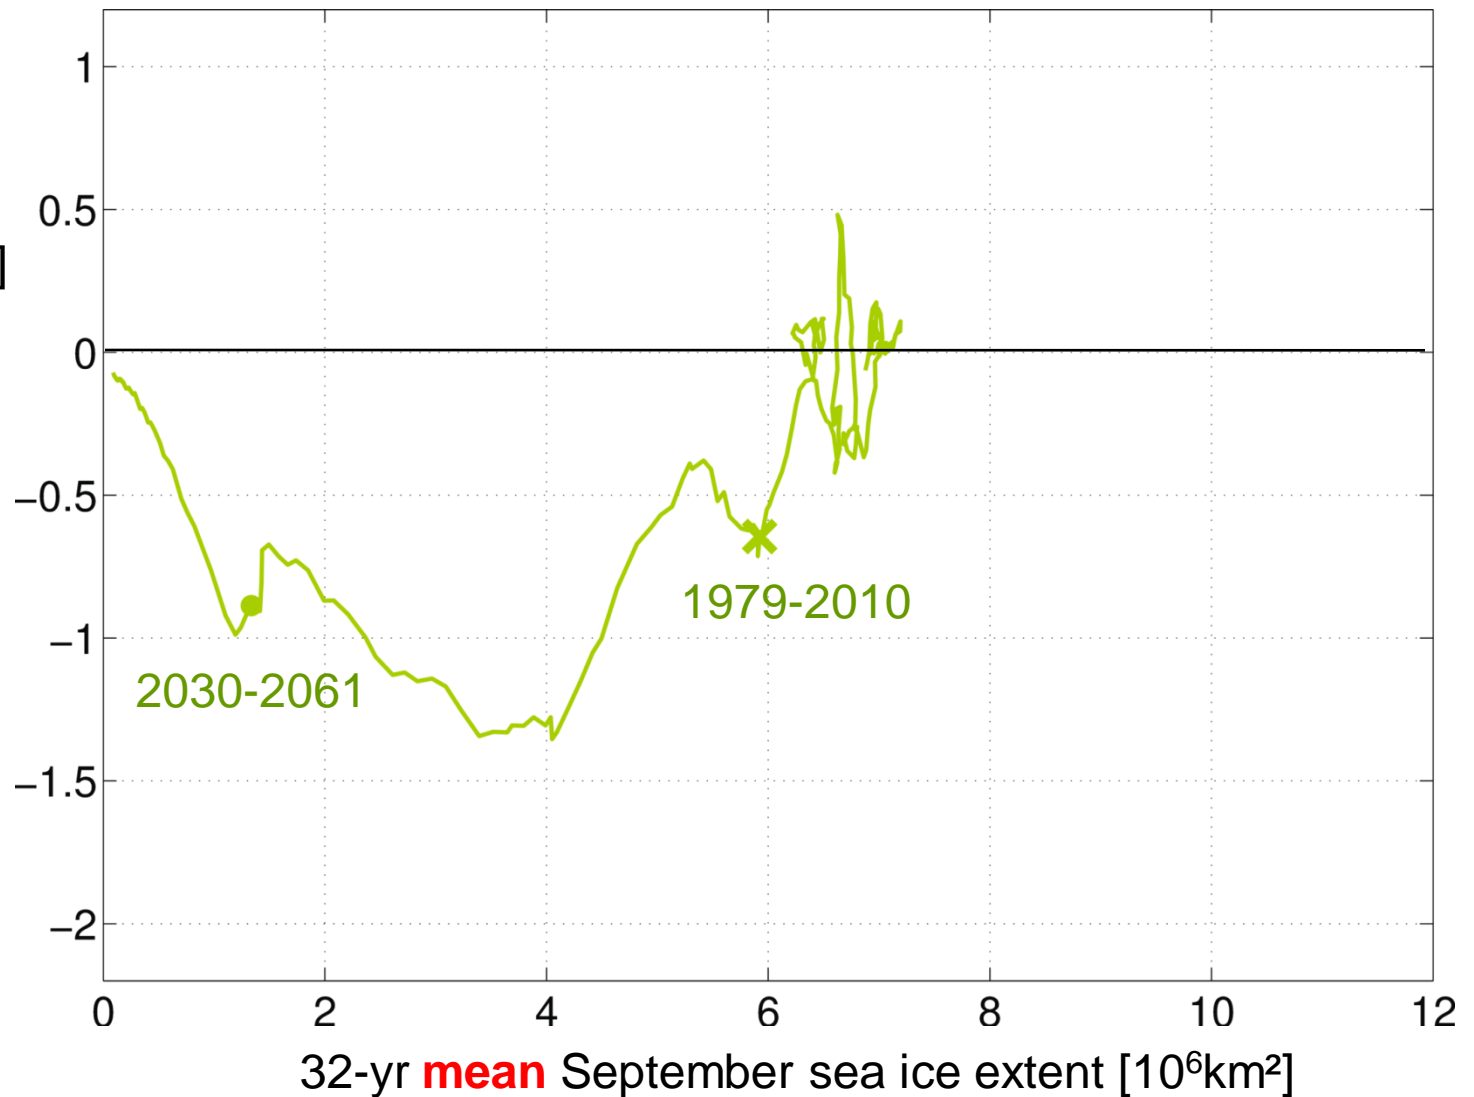

32-yr **trend** in  
September sea  
ice extent  
[ $10^6\text{km}^2/\text{decade}$ ]

# Mean sea ice conditions and variability are nonlinearly related to each other

32-yr **trend** in  
September sea  
ice extent  
[ $10^6\text{km}^2/\text{decade}$ ]

# Mean sea ice conditions and variability are nonlinearly related to each other

32-yr **trend** in  
September sea  
ice extent  
[ $10^6\text{km}^2/\text{decade}$ ]

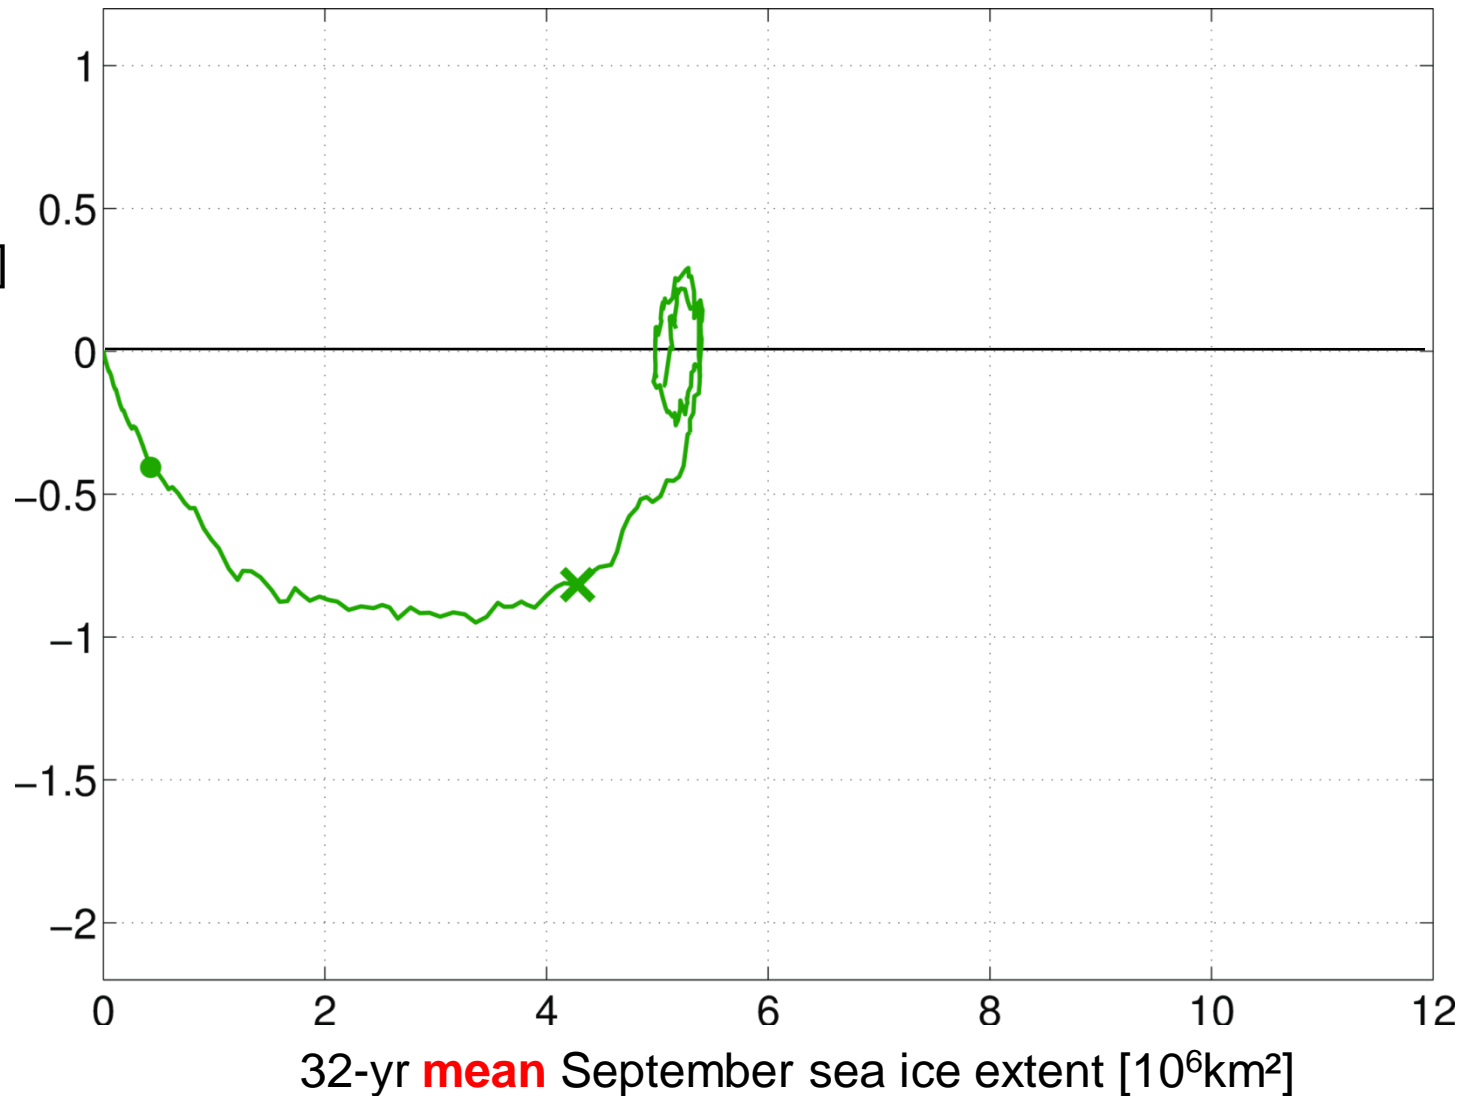

# Mean sea ice conditions and variability are nonlinearly related to each other

32-yr **trend** in  
September sea  
ice extent  
[ $10^6\text{km}^2/\text{decade}$ ]

# Mean sea ice conditions and variability are nonlinearly related to each other

32-yr **trend** in  
September sea  
ice extent  
[ $10^6\text{km}^2/\text{decade}$ ]

Constraints and correlations

**Yes, we can!**

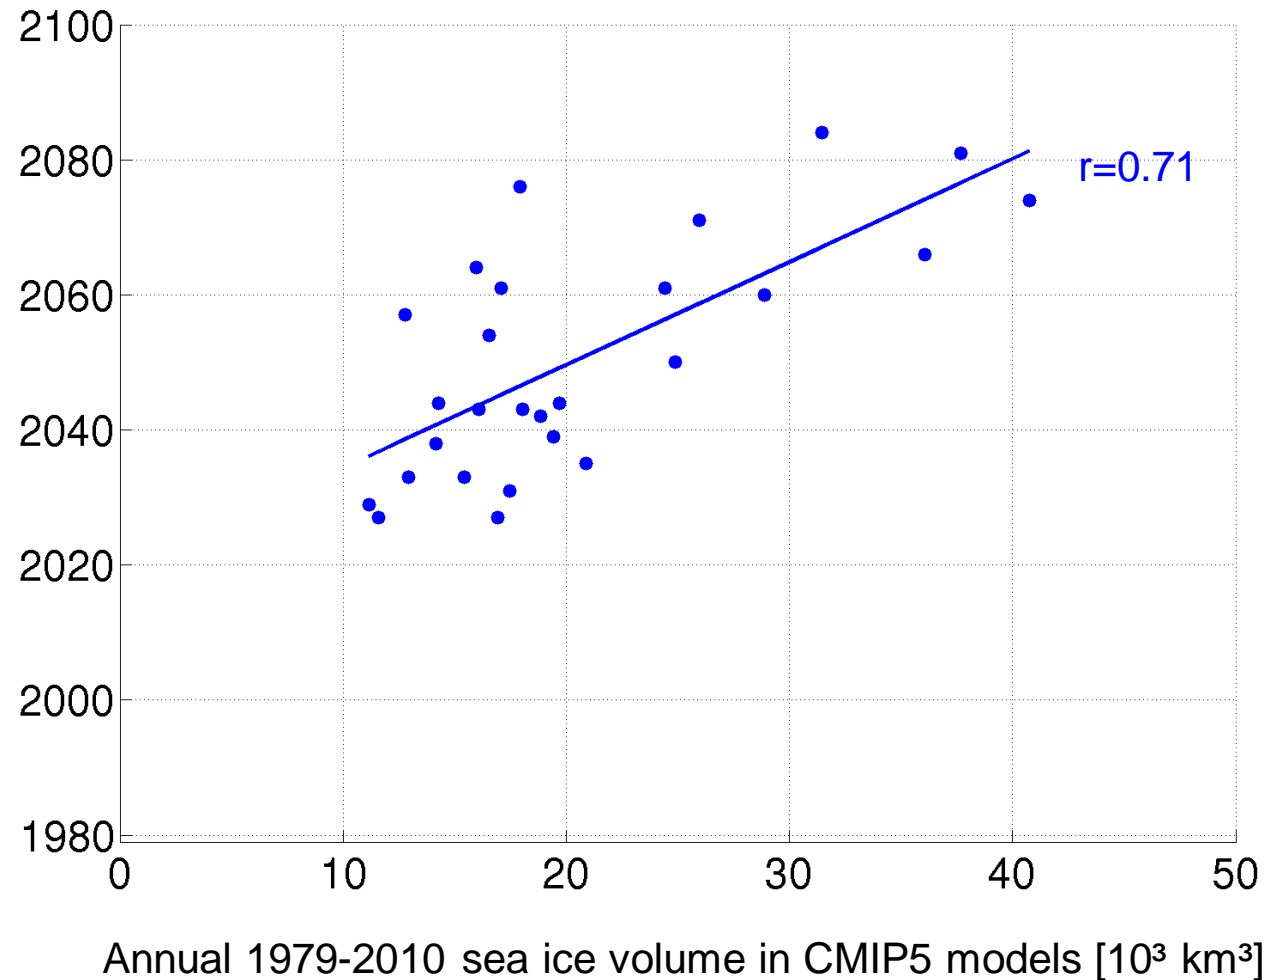

Effective model selection

# Dual problem: time as the dependent variable

# Year of disappearance relates linearly to present-day sea ice

First year with  
September sea ice  
extent < **1 million km<sup>2</sup>**

# Year of disappearance relates linearly to present-day sea ice

First year with  
September sea ice  
extent < **4 million km<sup>2</sup>**

Constraints and correlations

Yes, we can!

**Effective model selection**

# From qualitative patterns to quantitative evaluation

## Qualitative criteria for selection

from empirical and physically-based relationships:

- 1979-2010 mean September sea ice extent [NSIDC]
- 1979-2010 amplitude seasonal cycle of sea ice extent [NSIDC]
- 1979-2010 trend in September sea ice extent [NSIDC]
- 1979-2010 annual mean sea ice volume [Schweiger et al., 2011]

## Quantitative selection

based on arbitrary numerical thresholds (e.g., 20% within the observations)

Beware the perverse effects  
of internal variability

OBS

Beware the perverse effects  
of internal variability

Beware the perverse effects  
of internal variability

# Beware the perverse effects of internal variability

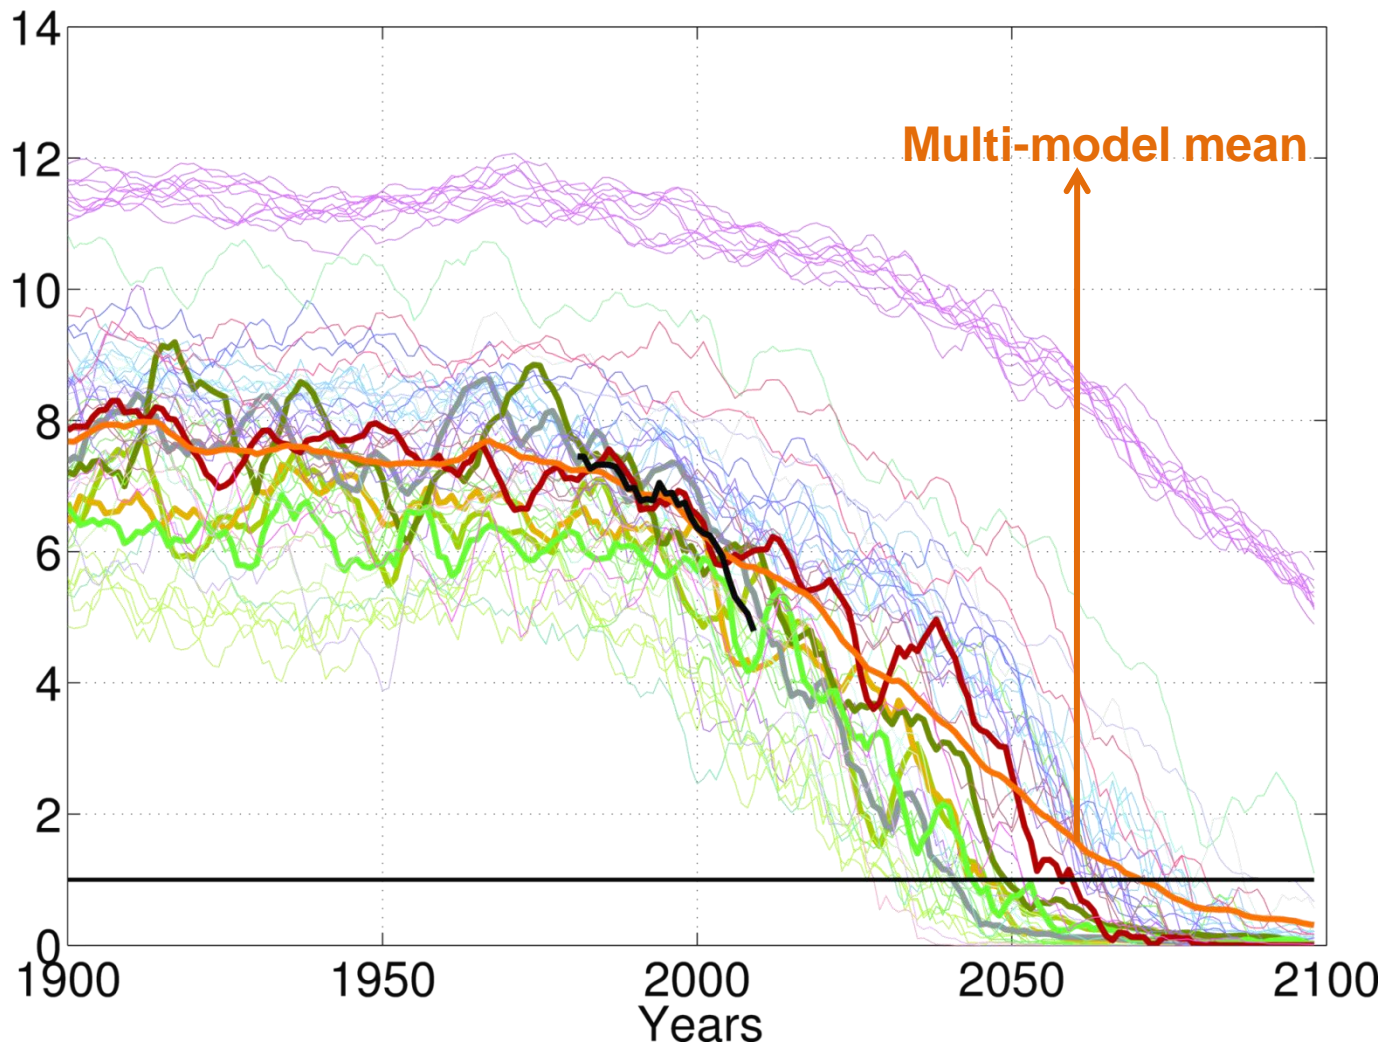

# Arctic sea ice-free in summer « When I'm 64 »

# Do's and don'ts with the multi-model mean

September sea ice extent [ $10^6 \text{ km}^2$ ]

## Constraints and correlations

Correlation does not mean physical relationship  
No correlation does not mean no relationship

## Yes, we can!

Relationships exist between  
present-day and future Arctic sea ice

## Effective model selection

High forcing scenario, possible summer  
ice-free conditions in the Arctic by 2040

*I'm an idealist without illusions*

John F. Kennedy

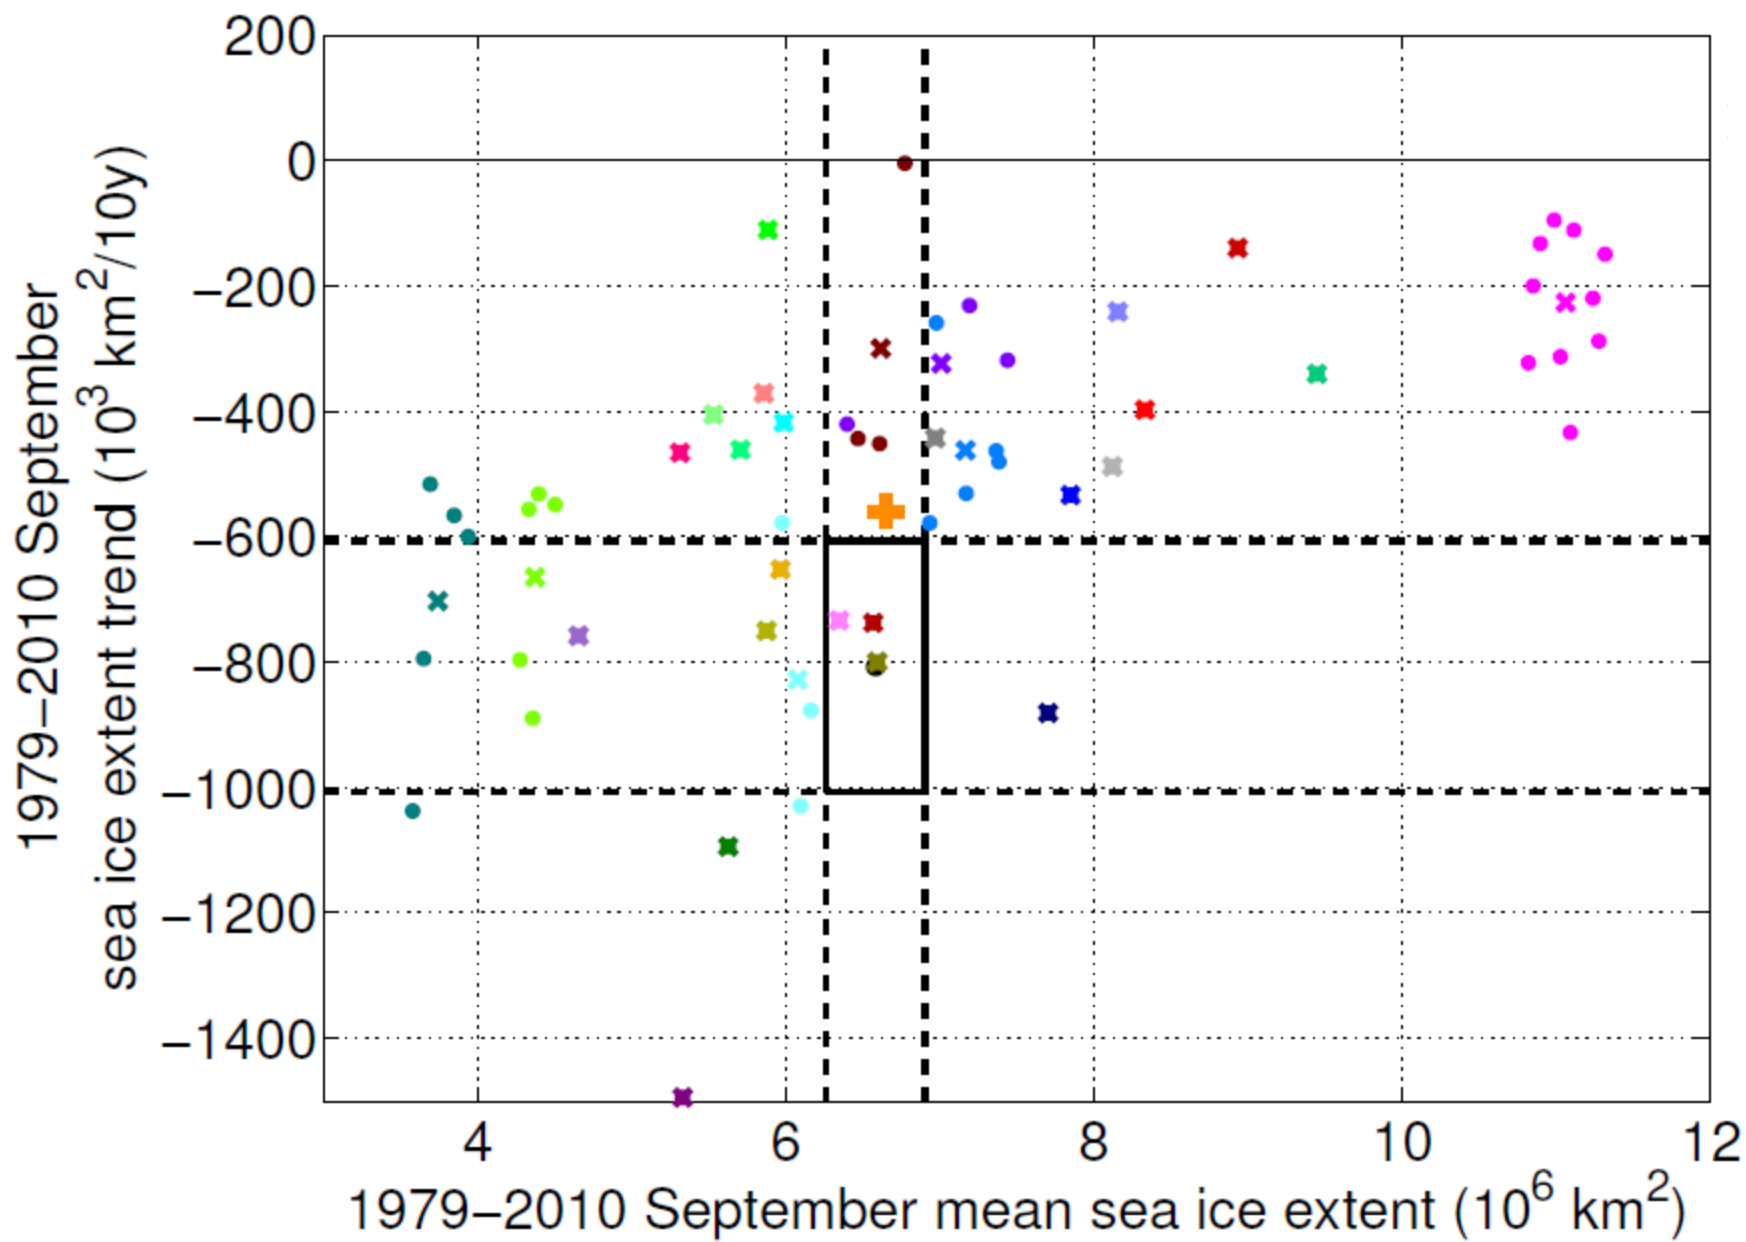

*I'm an idealist without illusions  
but we can work it out*
